

FOLLOW-UP INFORMATION AND INSTRUCTIONS FOR MEDICAL ABORTION

STARTING YOUR ABORTION

Inside the Mifegymiso medication box, you will find one **BLUE** box and one **ORANGE** box

Step 1: you will swallow the MIFEPRISTONE (ONE tablet in BLUE box):

- This pill will begin the abortion process.
- Most people have little to no side effects with this medication.
- You may start to bleed or cramp a bit but you still need to take the misoprostol (Step 2) as directed below.
- If you have been nauseous during your pregnancy, you may wish to take medication to prevent nausea (i.e. Gravol) before swallowing the mifepristone. If you vomit within an hour of taking the mifepristone, call us. If you vomit after 1 hour, the medication will still work.

STEP 2: you will open the MISOPROSTOL (FOUR tablets in ORANGE box):

WHEN TO USE THE MISOPROSTOL: At least 24 hours (1-2 days) after you swallow the MIFEPRISTONE

- This medication will help push out the pregnancy tissue.
- **For best pain relief, take Naproxen 500 mg OR Advil 800 mg 1 hour before inserting the misoprostol. This medication may cause stomach upset (take with food).**
- If you have been very nauseous during your pregnancy, you may also wish to take Gravol 50 mg one hour before misoprostol.

HOW TO TAKE:

- Wash your hands and remove the pills from the box
- **Choose ONE method:**

a) Place 2 of the tablets deep in each cheek pouch (4 total) between your cheek and lower gums. Keep the tablets there for 30 minutes and do not eat or drink during this time. After 30 mins, swallow the rest of the tablets.

OR

b) Place all 4 tablets deep inside the vagina and lie down for 20 minutes.

- Cramping and bleeding usually start 1 to 4 hours later
- Drink lots of **clear** fluids (juice, pop, broth, tea)
- Eat lightly because of the possibility of vomiting
- ***If you are between 9 and 10 weeks pregnant, you will take a second dose of this medication 4 hours after the first dose.***

MIFEGYMISO SCHEDULE:

Step 1: You will swallow the MIFEPRISTONE on _____ at _____
(DD/MM/YYYY) TIME

Step 2: Take 500 mg of Naproxen or 800 mg of Ibuprofen 60 minutes before taking MISOPROSTOL.

You will insert **all 4 MISOPROSTOL tablets** – a) 2 in each cheek pouch - and keep there for 30 minutes
b) deep in the vagina – and lie down for 20 minutes

Between _____ at _____ and _____ at _____
(DD/MM/YYYY) TIME (DD/MM/YYYY) TIME

Based on your last menstrual period (or other testing) we believe you to be _____ weeks pregnant.

If you are **9 - 10 weeks pregnant**, you will take a second dose of misoprostol (4 pills) **FOUR HOURS AFTER** your first 4 pills at:

_____ TIME

WHAT TO EXPECT

Cramping in the lower abdomen is normal and is the worst when your body is trying to pass the pregnancy tissue. Cramping often starts before the bleeding, within 2 hours of taking misoprostol. To help manage the cramps, you can rest, use a heating pad, massage your lower belly or take medications. **If the pain is not helped by Naproxen 500 mg, you may use 1-2 Tylenol #3 tablets taken 4 hours apart as a backup.** This medication may cause nausea. After the pregnancy tissue passes, cramping is usually mild & stops within 2-3 days.

Uterine Massage is done by taking the fingertips of both hands and pressing into your belly just above the pubic bone. This can be done for 5 minutes a few times a day to help move clots through and decrease bleeding and cramping.

Bleeding starts between 30 minutes and 24 hours of using misoprostol, usually within 2-4 hours. It is usually heavier than a period, sometimes with large clots. You may notice passing a small amount of white tissue or clot up to the size of a grape. This is the pregnancy tissue. After the second day, the bleeding should decrease to no more than a light-moderate period. The bleeding/spotting may continue for a few weeks. We recommend that you use pads for the first few days to allow you to monitor your bleeding until the bleeding slows down.

Sexual activity: You should avoid unprotected vaginal intercourse until your follow-up has determined that the abortion is complete. It is important for you to have a birth control plan in place because you can get pregnant before you get your first period.

Pregnancy Symptoms: Nausea and vomiting usually go away in a few days. Chest/breast tenderness, fatigue, and mood swings can take 2 weeks to go away, but should improve.

Pregnancy hormones (bHCG) remain in your body for up to 4 weeks after a medication abortion, so please **do NOT do a home pregnancy test before 4 weeks after your abortion**, as it may be falsely positive.

Birth control: You can get pregnant again within one week of having a medical abortion, even if you are bleeding. If you don't want to be pregnant, know that:

- Condoms can be used immediately
- Birth control pills/patch/ring or DepoProvera or Micronor can be re-started the day after Step 2 (misoprostol)
- IUDs can be inserted once the abortion is confirmed to be complete

EMERGENCIES:

Emergencies are rare but it is important to be prepared.

- It is important for you to be able to call us
- Consider who will drive you to the nearest hospital (ideally within one hour away) if necessary

GO TO EMERGENCY ROOM/CALL IF YOU HAVE:

- Excessive bleeding (soaking more than 2 large sanitary pads per hour for 2 consecutive hours)
- Severe abdominal pain not managed by the pain medications
- Continued vomiting or if you cannot keep fluids down for more than 6 hours
- A fever greater than 38C that starts more than 24 hours after taking misoprostol.
- A feeling of severe dizziness or fainting, chills or shortness of breath
- Symptoms of a tubal pregnancy: increasing one-sided pelvic pain, sharp shoulder pain

HOW TO CONTACT US:

Monday to Friday 8:00 am – 4:00 pm: Call our nursing line: **416-351-3726**

FOR URGENT MEDICAL ISSUES evenings/weekends: Call Women's College Hospital at **416-323-6400** & ask for the Bay Centre doctor on call.

If you feel your symptoms are so bad that you cannot wait for a return phone call, go to your nearest emergency room and TAKE THIS FORM WITH YOU. If you are not sure if you should go to the emergency room, please call us.

If you do not have OHIP or other valid health coverage, you may be required to pay for this emergency care.

MANDATORY PHONE FOLLOW-UP VISIT:

We will not know that your pregnancy has ended without a follow up visit. Follow up includes:

1) A phone-call from our team approximately **1 week after you start your medication abortion**. During this phone-call, we will ask screening questions to determine whether the pregnancy has likely passed.

Phone call from doctor on _____ **between 1:00 and 4:00 pm**
(DD/MM/YYYY)

If you do not hear from the doctor by 4:00 pm, please call the clinic.

2) A urine pregnancy test (purchased at the pharmacy) to be done at **4 weeks after the start of your medication abortion**. Our team will follow up after the 4 weeks to confirm this test was negative. If the test was positive, do not panic, please call us to discuss the next steps. Expect our phone call on: _____ (nurse will tell you the approximate dates)

If either you or the doctor are concerned, we will send a requisition for bloodwork at your local laboratory.

BE SURE TO KEEP YOUR FOLLOW-UP APPOINTMENT. If you are unable to follow the above instructions or keep your follow-up appointment, please call the Bay Centre at (416) 351-3726 Monday to Friday between 8:00 am – 4:00 pm.

To the receiving physician, please know the following:

- This medication abortion was administered using an evidence-based NO/LOW touch approach, supported by experts at the National Abortion Federation. Most likely the client did not receive pre-abortion ultrasound, hemoglobin or RH testing, or serial bHCG followup. The success of the abortion will be determined based on clinical history and a urine pregnancy test at 4 weeks post-abortion.
- As such, an ultrasound was (most likely) NOT performed:
 - o the gestational age of this pregnancy was estimated based on the last menstrual period (LMP) in an individual with a reliable menstrual history, and no risk factors for ectopic pregnancy
 - o intrauterine location of the pregnancy has not been confirmed, therefore ECTOPIC PREGNANCY HAS NOT BEEN RULED OUT
- Should the client have signs or symptoms suggestive of an ectopic pregnancy, please take this into consideration and arrange for urgent assessment and management.
- Our clinical team is ready to provide assistance / clarification via the emergency numbers provided to the client. Please do not hesitate to call.
